

A person wearing a dark jacket, blue jeans, and work boots stands behind a chain-link fence. The person is positioned in the center of the frame, with their hands in their pockets. The background shows an industrial structure with a large metal duct and a chain-link fence. The lighting is dramatic, with strong highlights and deep shadows.

PANTS & SHORTS  
COATS & JACKETS  
BODYWARMERS & FLEECE  
WATERPROOF RAIN SUIT  
CAPS & BACKPACKS

### WATERPROOFS 35

WATERPROOF TROUSERS  
WATERPROOF JACKET

### WORKWEAR 36

PANTS & SHORTS  
COATS & JACKETS

### FOOTWEAR 40

SAFETY FOOTWEAR

### 200J Safety Toe Cap

This symbol means that the item features a 200 Joules impact resistant toe cap.

### Penetration Resistant Steel Midsole

This symbol indicates that the item features a penetration resistant midsole.

### Metal-Free

This symbol shows that the item does not contain metal.

### Anti-Static Outsole

This symbol shows that the item's outsole features antistatic properties.

### Energy Absorbing Heel

Items displaying this symbol feature an energy absorbing heel region.

### Anti-Slip Outsole

Items displaying this symbol feature an anti-slip outsole.

SB - For safety footwear with a toe cap resistant to an impact of 200 Joules  
S1 - SB+Closed heel area, Energy absorption at seat area, Antistatic properties, Resistance to fuel oil  
S1P - S1+ Penetration resistance (P)  
S2 - S1 + Water penetration and absorption  
S3 - S2 Penetration resistance, Cleated outsole  
S4 - S1 + Entirely moulded polymer/rubber upper (e.g Wellington Boots) making them waterproof and leak proof  
S5 - S4+ Midsole penetration resistance.

#### Slip resistance ratings

Footwear that has passed tests for slip resistance will also have one of the following codes:  
SRA - Tested on ceramic tile wetted with sodium lauryl sulphate (a diluted soap solution)  
SRB - Tested on steel with glycerol  
SRC - Tested under SRA and SRB condition

#### Additional symbols/abbreviations

P - Penetration resistance  
C - Conductive  
A - Antistatic  
I - Electricity insulating footwear  
WR - Water Resistance  
M - Metatarsal Protection  
AN - Ankle Protection  
CR - Cut Resistant Upper  
WRU - Water Penetration and Water Absorption Upper  
HRO - Outsole Resistance to Hot Contact

The CE Marking in the garment shows that the product has been type examined in accordance with the Personal Protective Equipment Directive 89/686/EEC. This is a mandatory procedure and marking.

CE CERTIFIED

EN ISO  
11611

EN ISO 11611 - Protective Clothing for use in welding and allied processes.  
The protective clothing is intended for use against small splashes of molten material and short contact time with flame.

EN ISO  
20471

EN 20471:2013 - High-visibility clothing (EN 20471:2013 supersedes EN 471:2003/A1:2008.)  
In contrast to EN 471, ISO 20471 has one value (x), which indicates the class of the product. Since reflection is featured only in the highest class, the value (y) expires in ISO 20471. High-visibility clothing requirements increase visibility during the day, twilight, in the dark, and in poor weather conditions.

EN 1149-5

EN 1149-5 - Protective clothing - Electrostatic properties - Part 5: Material performance and design requirements  
EN 1149-5:2008 specifies material and design requirements for electrostatic dissipative clothing that is worn as part of a total earthed system for protection against incendiary discharges. Please note that this standard does not encompass protections against hazards associated with mains voltages and oxygen enriched workspaces.  
There are 2 different test methods in EN 1149-5:  
• EN 1149-1: 1995 measurement of surface resistivity (surface resistance)  
• EN 1149-3: 2000 measurement of charge decay

EN ISO  
13982-1

EN 13982-1:2004 - Protective clothing for use against solid particulates - Part 1: Performance requirements for chemical protective clothing that provides full-body protection against airborne solid particulates (type 5 clothing)  
(EN 13982-1:2004 supersedes EN 13982-1:2000 Development.)

This part of EN 13982 specifies the minimum requirements for chemical protective clothing resistant to penetration by airborne solid particulates (type 5). These garments provide full-body protection (i.e. they cover the trunk, arms, and legs; e.g., one-piece coveralls or two-piece suits, with or without hoods or visors and with or without foot protection). Requirements for component parts, such as hoods, gloves, boots, visors, or respiratory protective equipment are specified in other international and European Standards.

This part of ISO 13982 is applicable only to airborne solid particulates. It is not applicable to other hazards created by solid chemicals (e.g. penetration of chemical dust through materials by rubbing or flexing; countering such hazards form the bases for separate standards).

Information needed on labelling inside type 5 garments:

- Manufacturer/company name
- Identification or model number
- Number and date of this standard (i.e. EN ISO 13982-1:2004)
- Year of manufacture and, if appropriate, expected shelf-life
- CE marking indicating conformity with Directive 89/686/EEC
- Size designation in conformance with EN 340
- Pictogram chemical splash – type 5 and, if tested, type 6
- Pictogram for "read instructions"
- Maintenance symbols
- Marked according to relevant standards if the garments are tested for their electrostatic properties or as radioactive particle-tight clothing, clothing providing protection against infective agents, and clothing resistant to heat and flame
- PPE category

EN 343

EN 343 - Protective clothing - Protection against rain (EN 343:2003/A1:2007 supersedes EN 343:2003.)  
Protection against water penetration and water vapor:  
• X: Water penetration (3 levels, where 3 is best)  
• Y: Water vapor / breathability (3 levels, where 3 is best)

EN  
61482-1-2

EN 61482-1-2 - Protective Clothing against the thermal hazards of an electric arc (IEC 61482-2).  
Class 1 : Protection against electric arc 4kA  
Class 2 : Protection against electric arc 7kA

EN 471

EN 471 - High-visibility warning clothing for professional use - Test methods and requirements  
This standard details test methods and performance requirements for clothing designed to enhance the wearer's visibility in poor and low lighting, during bad weather, and in locations with mechanical hazards. Requirements include very bright colours (e.g., fluorescent) and retroreflective features (i.e., those with high reflectivity).

EN 381-5

EN 381-5 - Protective clothing for users of hand held saws - Part 5: Requirements for leg protectors  
This standard specifies three types or designs of leg protection (e.g., types A, B, and C differentiated by the kind and areas of protection) for those using handheld chainsaws.  
Type A – provides partial protection for both feet, with protective coverage starting 5 cm from the bottom of the leg to at least 20 cm above the escapement seam and extending 5 cm to the inside of the right leg and 5 cm to the outer side of the left leg.  
Type B – provides an additional 5 cm of protection on the inside of the left leg.  
Type C – covers the entire foot beginning more than 5 cm from the bottom of the leg to at least 20 cm above the front side seam step and to at least 50 cm below the rear of the stepper stitch.

This norm specifies 4 classes that correspond to the chain speeds used in tests:

- Class 0 : 16 m/s
- Class 1 : 20 m/s
- Class 2 : 24 m/s
- Class 3 : 28 m/s

EN 13034-6

EN 14605:2005 - Protective clothing against liquid chemicals - Type 3 or 4  
(EN 14605:2005 supersedes EN 467:1995, EN 465:1995, EN 466-1:1995.)

This standard specifies performance requirements for clothing with liquid-tight (type 3) or spray-tight (type 4) seams and includes requirements for apparel that provides protection for specific parts of the body only (types 3) and PB (4).

Types 3 and 4: Differences and Applications – Implications of Permeation Testing (EN 374-3 or ISO 6529)

The key difference between types 3 and 4 relates to the pressure and volume of a liquid spray:

- Type 3 is a strong jet of liquid such as that from a pressure sprayer
- Type 4 is a lighter spray such as that from a sprinkler system (i.e., substantial volume but lower in pressure)

In EN 14605 certification testing, this difference is reflected primarily in the finished garment spray test and not by any comparative mechanical property or by chemical permeation or barrier assessment tests.

Both types 3 and 4 must have sealed seams. EN 14605 requires at least one chemical permeation test on a seam (as well as the fabric) with a minimum score in class 1 (i.e. >10 minutes). No type of stitched seam will achieve this result against any chemical.

Type 3 and 4 certification also requires a permeation test on the fabric against at least one chemical with a minimum score in class 1 (i.e. >10 minutes). This standard does not specify that any particular chemical must be used for this test so, theoretically, a garment could be certified to type 3 or 4 with a permeation test against, for example, water while showing a normalised breakthrough of 11 minutes. However, a fabric with such a poor barrier against water would be unlikely to pass the finished garment spray tests.

Certification to types 3 and 4 does not indicate a general suitability for protection against any specific chemical or a general chemical protective application. An assessment of the permeation barrier against specific chemicals should be made as part of every risk assessment.

Permeation classification:

- Class 1 > 10 min
- Class 2 > 30 min
- Class 3 > 60 min
- Class 4 > 120 min
- Class 5 > 240 min
- Class 6 > 480 min

EN 342

EN 342 - Protective clothing - Ensembles and garments for protection against cold  
(EN 342:2004 supersedes EN 342:1998 and EN 342:2000.)  
Protection against temperatures lower than -5°C  
A: (U) Icler – basic thermal insulation for light / medium duty tasks  
B: (U) Icler – thermal insulation while standing still  
C: Air permeability (3 levels, where 3 is best)  
D: Water penetration resistance (2 levels, where 2 is best)

GO/RT  
3279

RIS-3279-TOM ISS 1 (GO/RT 3279)  
Railway Group High-Visibility Standard for UK. Defining the High-Visibility orange and the design of the garment i.e. fully fluorescent orange, no contrast colour and defined placement of the reflective tape.

EN ISO  
11612

EN ISO 11612 : Protective Clothing against Heat and Flame  
This standard supersedes EN 531, but please note that the garments that have an EN 531 certification remain valid. The standard specifies the performance requirements for garments which protect the body from heat and flame.  
Letter A represents Limited Flame Spread  
Letter B represents Convective Heat  
Letter C represents Radiant Heat  
Letter D represents Molten Aluminium Splash  
Letter E represents Molten Iron Splash

EN  
13758-2

EN 13758-2:2003+A1:2006 - UV protective apparel  
This standard specifies the requirements for marking clothing designed to provide the wearer with protection against solar ultraviolet (UV) radiation.

Garments marked according to EN13758-2 provide UVA + UVB protection against harmful UV rays. Prolonged exposure to the sun can cause skin damage. Wearing protective apparel designed in accordance with this standard reduces the dangers caused by UV exposure. While this apparel protects against UV radiation wearing this apparel does not guarantee protection in all conditions. Note that only areas covered by this apparel are protected and that the protection offered by this apparel may reduce with use, if stretched, or if wet. UV protective apparel should be cared for according to instructions inside each garment.

**Hi Vis Vest**

**MODEL NO: HV325**

- Basic High Visibility Vest
- Hook & Loop Fastening
- 2 Band and Brace
- Contrast Piping
